## CS 224(M): Tutorial 9

## ARP, ICMP, NAT & IPv6

Name: Dhruv llesh Shah Roll No.: 150070016

1.

96 24.05050100@14:dd:a9:37:fe:8f	Broadcast	ARP	42 Who has 192.168.1.3? Tell 192.168.1.73
135 43.59041100@ac:e0:10:e0:2f:3f	WibhuTec_dc:55:f0	ARP	42 Who has 192.168.1.3? Tell 192.168.1.19
136 43.59190600@ WibhuTec_dc:55:f0	ac:e0:10:e0:2f:3f	ARP	42 192.168.1.3 is at 00:11:74:dc:55:f0
145 49.59656200@ WibhuTec dc:55:f0	ac:e0:10:e0:2f:3f	ARP	42 Who has 192.168.1.19? Tell 192.168.1.3
146 49.59659000@ac:e0:10:e0:2f:3f	WibhuTec dc:55:f0	ARP	42 192.168.1.19 is at ac:e0:10:e0:2f:3f

2. Source MAC and Destination MAC can be seen on the left. IPs are a part of the message, seen on the right.

3.

4.

The ARP packets are generated again, after the arp -d.

5.

(My machine was used as the NAT router. This is the traffic on my machine)

8.

IPv6 has a fixed header size of 40 bytes, unlike IPv4 which has a header of 20 bits + options. Since the given case has no options, and the total size is limited by the MTU, IPv4 would have more payload capacity than IPv6.

9.

IPv6 routers do not support fragmentation or the Don't Fragment option. For IPv6, Path MTU Discovery works by initially assuming the path MTU is the same as the MTU on the link layer interface where the traffic originates. Then, similar to IPv4, any device along the path whose MTU is smaller than the packet will drop the packet and send back an ICMPv6 Packet Too Big (Type 2) message containing its MTU, allowing the source host to reduce its Path MTU appropriately. The process is repeated until the MTU is small enough to traverse the entire path without fragmentation.
